FOREWORD

The study on the Cost of Production and Marketing Margins of Various Agricultural Crops is very important for various kinds of stakeholders. This study has been an integral part of a regular activity of this program office. Such studies are conducted from the center as well as various District Agricultural Development Offices during recent years. The overall scenario of cost of production and its associated marketing margin is important particularly from stand point of policy makers, researchers, businessmen and individual farmers. Comparison of such statistics becomes important especially for a commercially driven type of agribusiness.

The policy of the program office has been to keep in record of such information in resources as far as possible. Therefore, using information from various formal and informal sources and coordinate such tasks with the respective District Agriculture Development Offices have been the recent approach of this office. The centre level is basically involved in monitoring and supervising such tasks as well as other socio economic studies of farmers, women and other disadvantaged groups in the country. Program office would continue putting its efforts in this direction in coming days too.

The time now is to think on how to keep cereal, vegetable and industrial crop production in a sustainable, profitable and prestigious manner with the thrust to give an effort to uplift the farming occupation, give striking profit margins in them over a period of time. We hope that the present study would serve dual functions of the Department of Agriculture in addressing the issues as per the needs of the people who serve the nation in various capacities.

This study is brought to the shape by our colleague Mr. Gokarna Sharma Acharya, and Mr. Lok Raj Subedi, Agri Economists. They deserve our special thanks as they also managed the computer work to bring out the report in this shape. I sincerely hope that the present study would be utilized as per the need and also hope to welcome useful and constructive comments and suggestions from the users for the improvements of data delivery system in the coming days.

Thank You!

Background Information and Notes on Cost of Production and Marketing Margin of Some Cereals, Vegetables, Industrial Crops and Spices

1. Introduction:

The importance of agriculture sector and its overall development is directly linked with the objectives of meeting basic needs of the people. Increasing farm production and farmers' income depend upon how the farmers plan and manage their farms. Farmers usually do production planning and management in their own judgment as per individual's family needs. However, they surely can maximize their farm income by adopting profitable enterprise. Management of resources for maximizing the returns and minimizing costs as well as improving the overall efficiency of farmers is the major concern of all the institutions involved in uplifting agricultural livelihood. Information on cost production is fundamental and is helpful to all the policy makers; agricultural scientist, researchers and farmers communities including the farmers need to be aware.

Cost of production is an aggregate of fixed and variable costs incurred in crop production. There exists substantial gap in our knowledge concerning critical aspects of farmers' decision-makers regarding profitability. Managing capabilities of farmers get improved once they come to realize some facts through available information or documents. Data on cost of production can help farmers in their decision making process during the selection of farming business. Farmers get knowledge of profitability in growing different suited to different agro climatic conditions by comparing the cost of production of different crops as well as other farming activities.

This report has been published in the earlier format on cost of production some Cereals, Vegetables and Spices as it used to be but in the present context, special emphasis has been given on Industrial Crops. Cotton and Sugarcane were the prime concerned industrial crops of the study and it might help in throwing we have put forward an effort to impart some light this concern as well.

There exists substantial gap in our knowledge concerning critical aspects of farmers' decision-making regarding profitability. Managing capabilities of farmers get improved once they come to realize some facts through available information or documents. The recorded data sets help in recommending to the farmers what to grow, how much to plant, which varieties yield higher and subsequent selection of crop types or varieties; growing conditions, level of inputs to be used etc. Farmers get knowledge or confirmation of profitability of growing different crops suited to their agro-climatic area. Data on the cost of production / cultivation play also important role in the decision making by the planners and policy makers thereby results in the well being of the farmers of even for the purpose of setting up good governance. The present report aims to fulfill the above kind of requirement for major agricultural growers concentrating on major Cereal Crops, Vegetables, Industrial crops and Spices.

2. Objectives:

The objective of this report is to provide information on production costs and returns of major cereal, cash, vegetables and spices crops by production condition by ecological belts.

The specific objectives are:

- To estimate cost of production of different crops by district those are noted to be important in terms of volume of production.
- To provide data on the cost and return of major arable crops by production condition by the use of technologies under different production conditions.
- To estimate marketing margins of various crop by districts.

3. Methodology:

The report has been compiled by conducting field surveys at different important crops growing areas of various districts. It also uses the published reports of some District Agricultural Development Offices (DADO) on cost of production of agricultural crops as part of their annual program and the input data supplied by the DADO. Similarly, the wholesale price data is used from the reports of Agribusiness Promotion and Market Development Directorate.

4. Rationale:

In the above background, present study represents the production level and input use in pocket areas of cereal crops of some important districts. The yield and input use level, therefore, as it will be noted, will appear to be higher compared to the national average production. Nevertheless, it is hoped that it would be helpful to assess the status of various efficiency indicators and provide basis to judge appropriate resource allocations by farmers so that the effective costs can be reduced to some extent if possible. In addition this report will also assist toward formulation of appropriate price policy.

5. Definition and Concepts:

The followings are the list of definitions and concepts used in the study.

5.1 Cost of Production:

Cost of production is reported in two forms viz. (a) Total Cost per hectare and (b) Cost per quintal.

(a) Total Cost:

This is the summation of all costs, both costs in cash and kind including household labor incurred during the production process.

(b) Cost per Quintal:

Cost per quintal is to be computed on the basis of "total cost" minus "value of by-product" divided by "volume of main product in quintals" using the following formula.

$$\text{Cost per Quintal} = \frac{\text{Total cost per hectare} - \text{Value of by-products}}{\text{Total volume of the main product in quintal}} \times 100\%$$

However, as no by-products were reported to have been valued, the by-product case is not applicable at this point. So the formula will remain at this moment as:

$$\text{Cost per Quintal} = \frac{\text{Total cost per hectare} - 0(\text{due to zero value of by-product})}{\text{Total volume of the main product in quintal}} \times 100\%$$

5.2 Production Condition:

Production condition may vary within and between the districts depending upon

its geographical conditions and niches of the respective districts. As for the study is concerned, it has taken an account of the mountains, hills and terai districts and its popular varieties. However being strict, the production condition denotes irrigation condition (irrigated/un-irrigated). Varieties of cereal crops (Local/Chaite/Improved) under which the crop in question is cultivated. Similarly other crops under the study comprises of improved cultivars and the land condition as irrigated/un-irrigated. In particular there are five such conditions for cereals under the study viz.

Cereal crops:

- a. Local under irrigated condition.
- b. Local under un-irrigated condition.
- c. Chaite under irrigated condition.
- d. Improved under irrigated condition.
- e. Improved under un-irrigated condition.

Vegetables, Industrial and Spices Crops:

- a. Crops planted under irrigated condition in the main cropping season.
- b. Crops planted under un-irrigated condition in the main cropping season.
- c. Crops planted under irrigated condition in the off-season.
- d. Crops planted under un-irrigated condition in the off-season.

5.3 Total Variable Cost:

Total variable costs are the costs at market price level and incurred both in cash or kind on items such as human labor, bullock labor, seed, manures, fertilizers, plant protection aids, staking or other costs like transportation charges. Level of these costs varies depending on production locations, technology and scale of production.

5.4 Human Labor:

Human labor forms one of the important components of cost involved in cost of production. It is measured in terms of adult man-day (eight working hours) in the field.

Human labor is expressed in adult man-day. Generally in rural areas, woman workday and child workday is converted in terms of adult man-day, and it is being calculated as it usually practiced.

- 1.25 woman days is equivalent to One-man day; implying 1 woman day = 0.8 man day.
- 2 child-days is equivalent to One-man day; implying 1 child day = 0.5 man day.

A. Own Family Labor:

It implies the labor contribution on farm by own family members. It is the main source of farm labor in case of small and medium sized farms. For estimating such costs, family labor has been valued as paid type of labor. Labor taken on exchange basis is also included in family labor.

B. Hired Labor:

Hired labor is the non-family labor employed for farm work on payment on wages in cash, kind or both.

5.5 Bullock Labor:

Bullock labor inputs are measured in terms of bullock day, which means use of a pair of bullock for eight hours. Bullock services costs have been calculated at the current market rate per pair of bullock per day. The cost incurred for ploughman is included under this item.

5.6 Manures and Fertilizers:

Manures and fertilizers are measured in physical as well as value terms. Marketing of manure is not usual in most of the rural areas of Nepal. As substantial amount of labor is involved in preparation of manure, a minimum cost is assigned. While taking an account of the fertilizers, urea, di-ammonium phosphate (DAP) and murate of potash (potash) are commonly available in the market and applied in the farms. The cost of fertilizers has been calculated on the basis of actual price paid by the farmers.

5.7 Irrigation:

Irrigation charge or cost incurred while hiring pump-set has been taken as actual amount paid. The labor involvement in irrigating field is accounted in human labor.

5.8 Seed:

Purchased seeds have been charged at market price. Utilization of own farm produced seeds has been evaluated at the local price during the sowing season.

5.9 Other Material Inputs:

Material inputs such as pesticides and insecticides have been taken at actual price paid have been evaluated accordingly.

5.10 Fixed Cost:

Fixed costs are those that do not vary with size of enterprise and have no bearing upon decisions to increase or decrease production. It includes land revenue, depreciation as well as tools and implements and interest in fixed assets.

5.11 Land Tax:

Agricultural land is classified into upland and lowland. The land survey has divided each type of land into 4 categories namely, Abbal, Doyam, Sim and Chahar. The land tax has been taken as actual tax paid by the farmers.

5.12 Other Tax:

It includes water tax and local tax and other governmental taxes if any levied in some special areas for specific unique purpose.

5.13 Depreciation:

Depreciation cost is calculated on the basis of purchase value and serviceable life of an asset. The serviceable life of an asset is ascertained from farmer's experience. The formulae for calculating annual depreciation cost is as follows:

Depreciation Cost = (Purchase value – Scrap value)/ Serviceable lifetime of the farm asset.

For those small agricultural tools and implements, which last around a year scrap, value is not taken into account since they are negligible.

Farm families have agricultural tools and these are used virtually for all most all crops. Depreciation charge for each crop is calculated by the following formulae:

Depreciation cost/Crop = (Area under a crop X Annual depreciation cost)/ Total cropped area

5.14 Interest on Working Capital:

Interest on the working capital is charged on cash at the rate of as 5 percent per annum

and thus calculated for a particular crop for the months it covers the arable land and it is incurred in the conditions such as:

- a. Hired human and bullock labor
- b. Hired tractor and pump-set
- c. Other taxes
- d. Expenses incurred on material inputs such as seeds, chemicals, fertilizers, manures, insecticides and pesticides.

5.15 Repairs and Maintenance:

Farmers in rural areas pay a fixed amount of their main produce to local blacksmiths who provide regular services of repair and maintaining services of agricultural tools and implements in rural areas. An annual repairing and maintenance cost is calculated by using the following formula:

$$\text{Repair and maintenance} = \frac{\text{Area under particular crop} \times \text{Grain quantity paid} \times \text{Price per unit}}{\text{Total Cropped Area}}$$

However, payments made by the farmer for the repair and maintenance all the year round are proportioned as per the crop duration and the area of cultivation.

5.16 Gross Income:

It is the value of the total crop produce (output) including main and by-product evaluated at farm gate price.

5.17 Output Input Ratio:

This is the ratio of the value of output including for by-product and the total cost of production on per hectare basis.

5.18 Gross Profit at Farm Gate:

It is the difference between the gross income to the total cost considering the product price at farm gate.

5.19 Other Efficiency Indicators:

The users may make their own choice should they be looking for some unique indicators of their research agenda.

5.20 Net Profit: Marketing Margin:

It is the difference between the gross profits to marketing cost adding value of main product in it.

5.21 Value at Market:

It is the price of the total marketed volume at the respective near most market where farmers sell their product at wholesale price. In case of cereals and cash crops a same criterion is adopted for calculating the value at market considering the same district's or the relevant near most wholesale market price by deducing five percent post harvest and handling loss in total quantity of main product.

Where as in case of vegetables, the value at market is the total volume of product deducing the marketing loss multiplied by the value at the market. The losses incurred during the transportation and handling of the commodity has been calculated ranging from two to fifteen percent as per the nature of the nature of the commodity. The value at market is determined by the market price prevailed in the relevant near most wholesale market for the each vegetable and spice crop taken an account for the study. The market may be the same district of the market of the neighboring district or even the distant market like Kathmandu.

The wholesale market price of each vegetables and spices crops undertaken in the study as per the districts are as follows:

AVERAGE COST OF PRODUCTION & MARKETING MARGIN PER HECTARE

DISTRICT: Jhapa

Crop: Paddy
Seed: Chaite-2

Year: 2010/2011
